

# FeV

## xCAR™

The single tool you need  
for automotive virtual testing

feel evolution

# xCAR™

## xCAR™ ensures a continuity throughout the different levels of virtualization

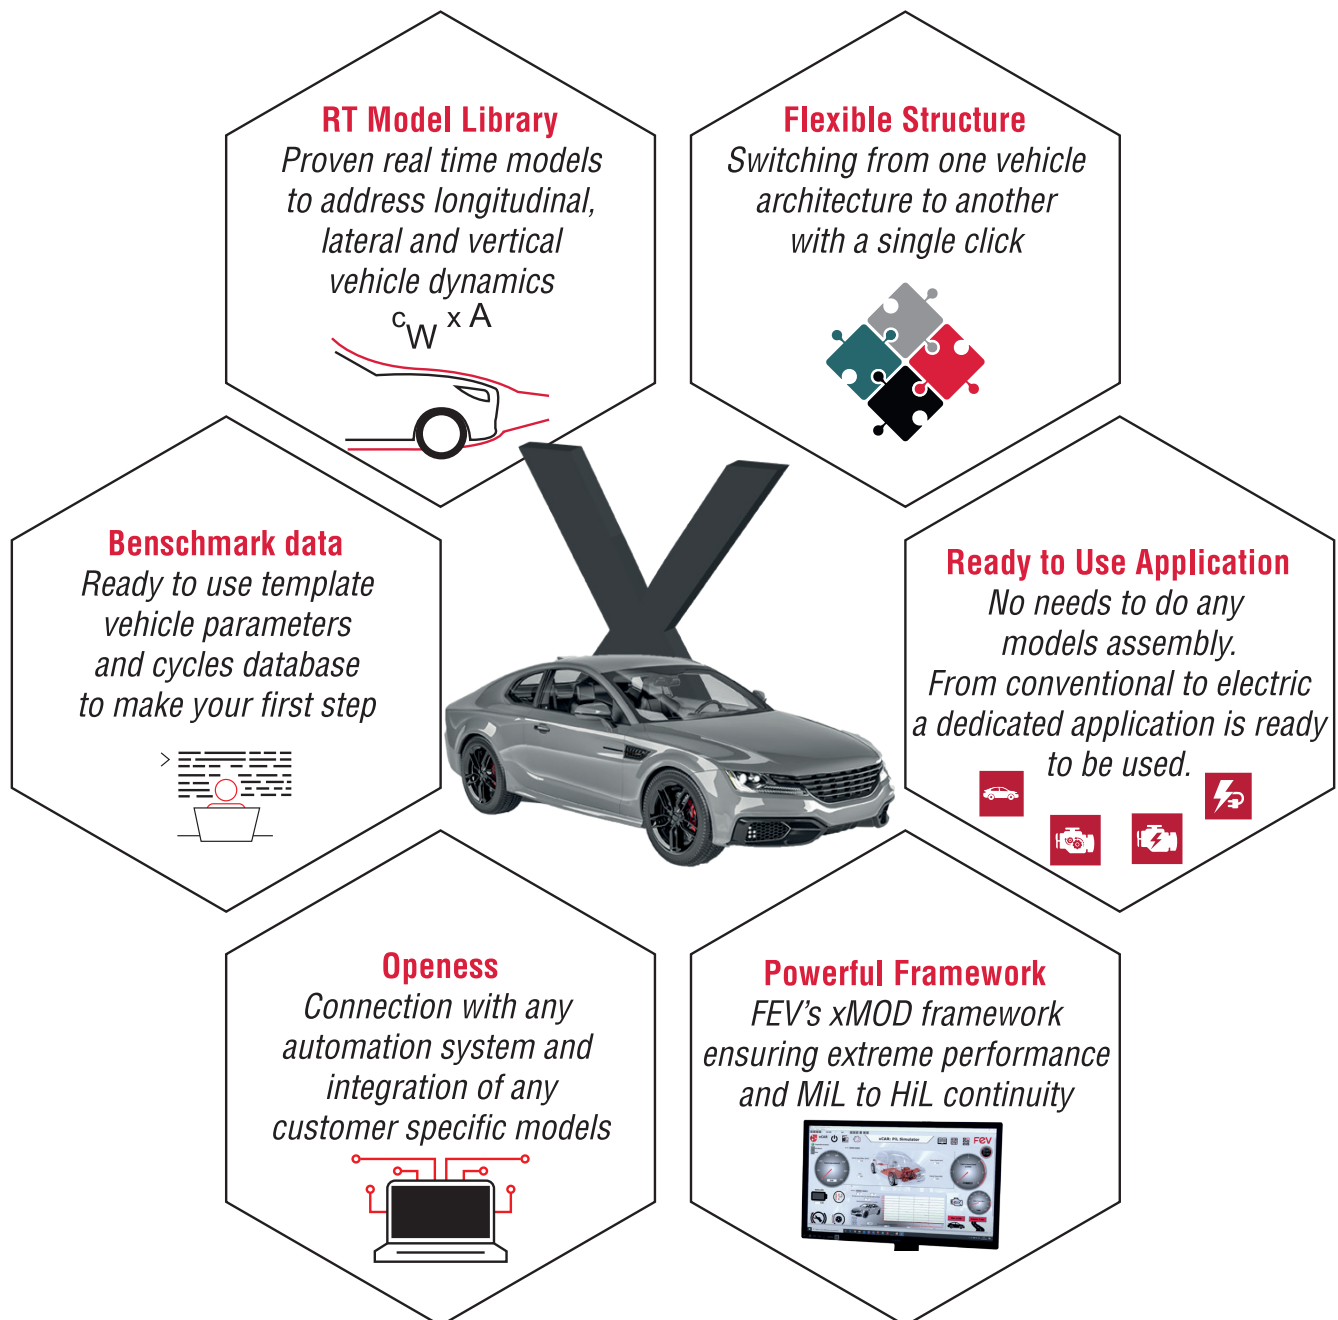

The increasing powertrain complexity combined with the new requirements defined by evolving emission legislations are intensifying the challenges to be accomplished within the calibration process and consequently are leading to a much higher number of physical tests in different scenarios.

To help you overcome these challenges, we developed dedicated simulation solutions for virtual testing based on modern x-in-the-loop framework. xCAR™ is the cornerstone of our continuous x-in-the-loop process, ranging from the design stages (purely virtual) to road tests (fully real) and introducing, step by step, the right share of virtualization for every stage of the development process.

## With xCAR™, optimize your effort, focus on what matters!

# Optimize your effort

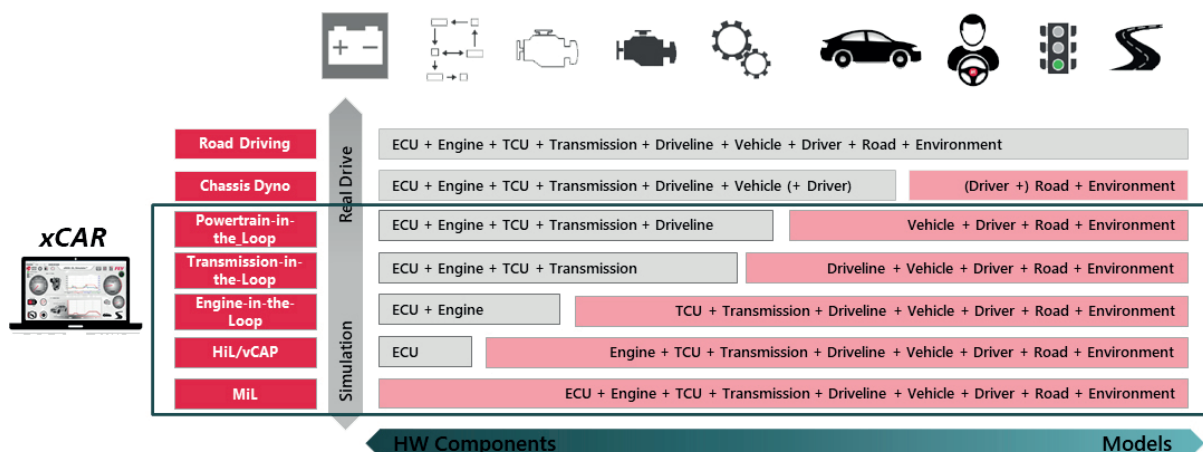

## Focus on what matters

# Solution

To help you overcome these challenges, we developed dedicated simulation solutions for virtual testing based on modern x-in-the-loop framework. xCAR™ is the cornerstone of our continuous x-in-the-loop process

(see figure below), ranging from the design stages (purely virtual) to road tests (fully real) and introducing, step by step, the right share of virtualization for every stage of the development process.

The xCAR™ XiL application offers a model structure describing the entire vehicle for any type of powertrain, with e.g. an engine block, a battery block, an electrical block, a vehicle block, a transmission block, an energy management system block and a driver block. The interface has been created to be used not only by simulation specialists but also by calibration engineers

and test bench operators. In this user-friendly interface, the needed architecture can be easily selected – combustion engine, hybrid or electric motor. It enables an online modification of the parameters for each component (gearbox, brakes, wheels, vehicle etc.) as well as importing customized RDE cycles.

# "xCAR™ ensures a continuity throughout the different levels of virtualization."

## Benefits

- > Cranktrain
- > Valvetrain
- > Piston and Ringpack
- > Timing and Accessory Drive
- > Geartrain
- > TEHD Bearing analysis
- > Load prediction
- > Firing order optimization
- > Friction and wear prediction
- > NVH analysis

## Use cases

- > Desktop simulation for concept exploration and components sizing
- > Virtual hybridization of complete vehicle concept on engine test bench
- > Exhaust aftertreatment screening on engine test bench
- > OBD calibration on engine test bench
- > E-motor performance in different vehicle layout and powertrain architecture on an e-motor test bench
- > Objectified longitudinal drivability calibration on a powertrain test bench
- > And so on, letting your imagination simulate the multiple possibilities
